Q.	Question	Marks	BL	CO	PO	PI
No						Code
1	There are the following statements that are given	1	L1	1	1	1.6.1
	below, which of them are correct OP code used in ARP					
	message format? *					
	a. the OP code is used to specify the type of ARP message.					
	b. the OP code is part of only the ARP request message.					
	c. the OP code 1 is used for ARP request.					
	d. the OP code 0 is used for ARP reply.					
2	Which of the following is correct about User Datagram	1	L1	1	1	1.6.1
	Protocol					
	a. UDP has flow control mechanism					
	b. There is window mechanism in UDP					
	c. There is no robust error control mechanism in UDP					
	d. UDP provides error correction					
3	Size of TCP segment header ranges between	1	L1	1	1	1.6.1
	a. 16 and 32 bytes					
	b. 16 and 32 bits					
	c. 20 and 60 bytes					
1	d. 20 and 60 bits	1	T 1	1	1	1 ( 1
4	During error reporting, ICMP always reports error	1	L1	1	1	1.6.1
	messages to a. Destination					
	b. Source					
	c. Next router					
	d. Previous router					
5	In the algorithm of TCP, the size of the	1	L1	1	1	1.6.1
	congestion window increases exponentially until it	1	ГЛ	1	1	1.0.1
	reaches a threshold.					
	reaches a un eshviu.	l				

_				T	1	Т
	a. slow-start					
	b. congestion avoidance					
	c. congestion detection					
	d. Congestion control					
6	Transport layer aggregates data from different	1	L1	1	1	1.6.1
	applications into a single stream before passing it to					
	a network layer					
	b. data link layer					
	c. application layer					
	d. physical layer					
7	UDP perform functions.	1	L1	1	1	1.6.1
	a. end-to-end reliable data delivery					
	b. process-to-process communication					
	c. host-to-host communication					
	d. host-to-server communication					
8	is a technique that refers to a congestion	1	L1	1	1	1.6.1
	control mechanism in which a congested node stops					
	receiving data from the immediate upstream node or					
	nodes.					
	a. Backpressure					
	b. Discard					
	c. Choke					
	d. Explicit					
9	The address, also known as the link address,	1	L1	1	1	1.6.1
	is the address of a node as defined by its LAN or WAN.					
	a. Physical					
	b. IP					
	c. Port					
	d. Specific					
10	In IPv4, service type of service in header field, first 3	1	L1	1	1	1.6.1
	bits are called					
	a. Type of service					
	b. Code bits					
	c. Sync bits					
	d. Precedence <b>bits</b>

10	d. Precedence bits	1	L1	1	1	1.6.1

	Part – B					
	$(5 \times 2 = 10 \text{ Marks})$					
11	i) An IP packet has arrived in which the offset value	5	L3	1	2	2.6.3
	is 100, the value of HLEN is 5 and the value of the					
	total length field is 100. What is the number of the					
	first byte and the last byte?					
	Each step carry 1 marks					
	Total length = 100					
	HLEN = 5*4 = 20					
	Data length = total length $-$ HLEN = $100-20 = 80$					
	First byte = 100 *8 =800					
	Last byte = $800 + 80 - 1 = 879$					
	ii) Explain TCP Connection establishment process	10	L2	1	1	1.6.1
	in detail with a neat diagram.					
	Diagram: 3marks					
	Explanation: 7 marks					
	The three handshakes are discussed in the below steps:					
	Step 1: SYN					
	SYN is a segment sent by the client to the server. It acts					
	as a <b>connection request</b> between the client and server.					

	1	1		1		1
	It informs the server that the client wants to establish a					
	connection. Synchronizing sequence numbers also					
	helps synchronize sequence numbers sent between any					
	1 1 1					
	two devices, where the same SYN segment asks for the					
	sequence number with the connection request.					
	Host SYN (SEQ = X)					
	SYN (SEQ = Y, ACK = X + 1)					
	A SEQ = X + 1, ACK = y + 1 B					
	Time Time					
	Client Server					
	Three way Handshake					
	Step 2: SYN-ACK					
	=					
	It is an SYN-ACK segment or an SYN + ACK segment					
	sent by the server. The ACK segment informs the client					
	that the server has received the connection request and					
	it is ready to build the connection. The SYN segment					
	informs the sequence number with which the server is					
	ready to start with the segments.					
	Step 3: ACK					
	±					
	ACK (Acknowledgment) is the last step before					
	establishing a successful TCP connection between the					
	client and server. The ACK segment is sent by the					
	client as the response of the received ACK and SN					
	from the server. It results in the establishment of a					
	reliable data connection.					
	After these three steps, the client and server are ready

Q.	Question	Marks	BL	CO	PO	PΙ
No						Code
1	How many bytes are reserved for target hardware	1	L1	1	1	1.6.1
	address in ARP message format?					
	a. 4 bytes					
	b. 6 bytes					
	c. 8 bytes					
	d. 16 bytes					
2	The transport layer protocol used for real time	1	L1	1	1	1.6.1
	multimedia, file transfer, e-mail and DNS respectively					
	are					
	a. UDP,TCP,TCP and UDP					
	b. TCP,UDP,UDP and TCP					
	c. UDP,TCP,TCP AND UDP					
	d. TCP,UDP,TCP AND UDP					
3	Connection establishment in TCP is done by which	1	L1	1	1	1.6.1
	mechanism?					
	a. Flow control					
	b. Three-Way Handshaking					
	c. Forwarding					
	d. Synchronization					
4	Which of these is not a type of error-reporting	1	L1	1	1	1.6.1
	message?					
	a. Destination unreachable					
	b. Source quench					
	c. Router error					
	d. Time exceeded					
5	To accomplish flow control, TCP uses a	1	L1	1	1	1.6.1
	window protocol.					
	a. limited-size					
	b. sliding					
	c. fixed-size					

	d. variable					
6	Which of the following is false with respect to UDP?	1	L1	1	1	1.6.1
	a. Connection-oriented					
	b. Unreliable					
	c. Transport layer protocol					
	d. Low overhead					
7	The value of acknowledgement field in a segment	1	L1	1	1	1.6.1
	defines					
	a. sequence number of the byte received previously					
	b. total number of bytes to receive					
	c. sequence number of the next byte to be received					
	d. sequence of zeros and ones					
8	In case of time exceeded error, when the datagram	1	L1	1	1	1.6.1
	visits a router, the value of time to live field is					
	a. Remains constant					
	b. Decremented by 2					
	c. Incremented by 1					
	d. Decremented by 1					
9	Which field helps to check rearrangement of the	1	L1	1	1	1.6.1
	fragments?					
	a. offset					
	b. flag					
	c. ttl					
	d. identifier					
10	In IPv4 layer, datagram is of	1	L1	1	1	1.6.1
	a. Fixed length					
	b. Variable length					
	c. Global length					
	d. Zero length

Gield specifies how many or receive. or a checksum to check ot. are used when the URG ointer is used to indicate and can be anywhere					
i) Brief	about l	how error contr nsmission of seg		5	L2	1	1	1.6.
			gment is missing, er, corrupted when it is					

		1	1	1	1	1
	ed by the receiver then that segment is					
	smitted again. Segments are retransmitted only					
	g two events: when the sender receives three					
duplic	ate acknowledgements (ACK) or when a					
retrans	smission timer expires.					
	<b>Retransmission after RTO:</b> TCP always					
	preserves one retransmission time-out (RTO)					
	timer for all sent but not acknowledged					
	segments. RTT is the time duration needed for					
	a segment to reach the receiver and an					
	acknowledgement to be received by the					
	sender.					
2	Retransmission after Three duplicate ACK					
۷.						
	segments: RTO method works well when the					
	value of RTO is small. If it is large, more time					
	is needed to get confirmation about whether a					
	segment has been delivered or not. Sometimes					
	one segment is lost and the receiver receives					
	so many out-of-order segments that they					
	cannot be saved. In order to solve this					
	situation, three duplicate acknowledgement					
	method is used and missing segment is					
	retransmitted immediately instead of					
	retransmitting already delivered segment. This					
	is a fast retransmission because it makes it					
	possible to quickly retransmit lost segments					
	instead of waiting for timer to end.					
;;) Cal	culate the checksum for the following ICMP	10	L3	1	2	2.6.3

Set - D

SRM Nagar, Kattankulathur – 603203, Chengalpattu District, Tamil Nadu

Academic Year: 2022-23 (ODD)

Test: CLA-T1 Date: 07-09-2022 Course Code & Title: 18CSC302J - Computer Networks Duration: 1 Hour Year & Sem: III Year / V Sem Max. Marks: 25

	Part – B							
	$(1 \times 15 = 15 \text{ Marks})$							
Instr	uctions: Answer ANY One questions							
Q.	Question	Marks	BL	CO	РО	PI		
No						Code		
11	i) An IP datagram is carrying 2048 bytes of data. If	5	L3	1	2	2.6.3		
	there is no option information, what is the value of the							
	header length field? What is the value of the total							
	length field?							
	ii) With a neat diagram Illustrate the various fields in	10	L2	1	1	1.6.1		
	ARP Header							
	(OR)							
12	i) write short notes on Error control in TCP and show	5	L2	1	1	1.6.1		
	how it is achieved through the use of three simple tools							
	ii) Calculate the checksum for the following UDP	10	L3	1	2	2.6.3		
	packet:							
	Source IP: 153.18.8.105							
	<b>Destination IP: 171.2.14.10</b>							
	Reserve bytes: 0							
	Protocol: 17							
	UDP pseudo header total length: 15							
	Source port address:1087							
	Destination port address:13							
	UDP header length:15							
	Checksum: Initial							
	Message : TESTING							

#### Course Outcome (CO) and Bloom's level (BL) Coverage in Questions

L1 - 25% (10 Marks) CO1 - 100%

L2 – 37.5% (15 Marks) L3 – 37.5% (15 Marks)

10	b. 123	1	L1	1	1	1.6.1

	Part – B					
	$(5 \times 2 = 10 \text{ Marks})$					
11	i) An IP datagram is carrying 2048 bytes of data. If	5	L3	1	2	2.6.3
	there is no option information, what is the value of					
	the header length field? What is the value of the					
	total length field?					
	Data-size = 2048 bytes.					
	Header-size = 20 bytes					
	HLEN = 20/4 = 5.					
	Total length of datagram = $2048 + 20 = 2068$ bytes					
	ii) With a neat diagram Illustrate the various fields	10	L2	1	1	1.6.1
	in ARP Header. Diagram: 3marks					
	Explanation: 7marks					
	• <b>Hardware Type</b> –It is 1 for Ethernet.					
	• <b>Protocol Type</b> —It is a protocol used in the					
	network layer.					
	• Hardware Address Length-It is the length in					
	bytes so that it would be 6 for Ethernet.					
	• <b>Protocol Address Length</b> – Its value is 4					
	bytes.					
	• <b>Operation Code</b> indicates that the packet is					
	an ARP Request (1) or an ARP Response (2).					

	<ul> <li>Senders Hardware Address – It is a hardware address of the source node.</li> <li>Senders Protocol Address - It is a layer 3 address of the source node.</li> <li>Target Hardware Address – It is used in a RARP request, which response impact both the destination's hardware and layer 3 addresses.</li> <li>Target Protocol Address – It is used in an ARP request when the response carries both layer 3 addresses and the destination's hardware.</li> </ul>					
	Hardware Length (PLEN) Operational request (1), reply (2)					
	Sender Hardware Address (SHA)					
	Sender Protocol Address (SPA)					
	Target Hardware Address (THA)					
	Target Protocol Address (TPA)					
	OR		•	1	1	
12	i) write short notes on Error control in TCP is achieved through the use of three simple tools  Error control also includes a mechanism for correcting errors after they are detected. Error detection and correction in TCP is achieved through the use of three simple tools: checksum, acknowledgment, and time-out.  Checksum:  Each segment includes a checksum field which is used to check for a corrupted segment.  Acknowledgment:  TCP uses acknowledgments to confirm the receipt of data segments.  Retransmission:  The heart of the error control mechanism is the retransmission of segments. When a segment is corrupted, lost, or delayed, it is retransmitted.	5	L2	1	1	1.6.1
	ii) Calculate the checksum for the following UDP packet: Source IP: 153.18.8.105 Destination IP: 171.2.14.10 Reserve bytes: 0 Protocol: 17 UDP pseudo header total length: 15 Source port address:1087 Destination port address:13 UDP header length:15 Checksum: Initial Message: TESTING	10	L3	1	2	2.6.3
